ATTITUDE AND PERCEPTION OF PHYSICAL THERAPISTS TOWARDS MULTIDISCIPLINARY TEAM APPROACH IN STROKE REHABILITATION

Muhammad Naveed Babur¹, Dr. Shiasta Habibullah Anam Altab²
Isra University, Islamabad Campus

ABSTRACT

INTRODUCTION

Stroke is a long term disability in developing countries which is considered as major economic burden on part of Health care system. In developing countries multidisciplinary team approach for stroke rehabilitation is emerging in tertiary care hospitals and has considerably increased the chance of early independence, fast recovery and maximum outcome in daily activities of life.

Objective: Objective of the study was to evaluate the attitude and perception of physical therapists towards multidisciplinary team approach working in stroke rehabilitation.

METHODOLOGY

The study was conducted in major cities of Pakistan in tertiary care hospitals. Physiotherapists working in multidisciplinary line service with 2-year experience. Data was collected through structured questionnaire Attitude Towards Health Care Team Scale (ATHCT) and analyzed through SPSS version 20.

RESULTS

Findings indicate that the perception of physical therapists towards multidisciplinary team approach is excellent with better outcomes. They believe in team work while treating stroke patients for early independence.

CONCLUSION

Physiotherapists perceived that MDT approach makes the delivery of Health care in stroke rehabilitation more efficient and achievable. Quality care and patient satisfaction can be improved while treating in team.

Key words

MDT (multidisciplinary team), ESD (early stroke discharge), WHO (world health organization).

INTRODUCTION

According to world health organization stroke or cerebrovascular accident is a rapidly developing clinical sign of focal disturbance of cerebral function lasting for more than 24 hours with the interruption of death with no obvious cause of vascular origin.”(1)

There are two main types of stroke ischemic stroke and hemorrhagic stroke but the occurrence rate of ischemic type is 80% which causes high economic burden on the developing countries. (2) In developing and developed countries the most prevalent cause of disability is stroke. (3) Fifteen million is the total global annual incidence of stroke and out of the one-third of them die because of secondary complications of stroke. (4) It was noted in the Western population that the incidence rate of stroke has been declined but in the South Asian countries like Pakistan and India the incidence rate of stroke has inclined. Because of uncontrolled and undiagnosed hypertension the incidence rate of hemorrhagic stroke is higher (21-31%) in Pakistan in comparison with Western World (10-15%). (5,6) In the follow up rehabilitation only Western countries stroke usually affects geriatric population but in Pakistan it usually affects the younger population. Stroke is a long term disability which causes economic burden which is considered as a burning issue. (7,8)

Stroke rehabilitation is defined as “a multidisciplinary progressive, dynamic, goal-oriented process aimed at enabling a person with impairment to reach optimal, physical, cognitive, emotional, communicative and/or social functional level.” The management of stroke is based on the intensive intervention and performance of different purposeful
activities. (2, 9-11)
Core and periphery members are the constituents of multidisciplinary teams in hospitals. Core members are usually the foundation of stroke units, and less usually part of an early stroke discharge team, which is usually based on in a community setting or in an inpatient unit. The members of the core group include stroke physicians, nurses, physiotherapists, speech and language therapists, occupational therapist and health care assistants. Support is provided by the therapy assistants to physiotherapists or occupational therapists. Moreover physiotherapists, speech language therapists, occupational therapists and nurses are supported by generic rehabilitation assistants.

There is unambiguous evidence of better outcomes when stroke patients are treated by multi-disciplinary teams in a stroke unit. (12). In comparison with conventional treatment organized care of stroke inpatients resulted in decline in death, dependency and requirement for institutional care for a longer duration of time. The beneficial outcomes of early stroke discharge teams earlier discharge from hospitals, increase in the chances that that patient will gain independence in activities of daily living.12,13,14
The study aimed to evaluate the attitudes and perceptions of physical therapists towards multi-disciplinary teams for stroke rehabilitation. The study is one of the new studies conducted in Pakistan regarding the attitudes and perception of physical therapists towards MDT in stroke rehabilitation

**METHODOLOGY**

This cross sectional study was conducted in different hospital of main cities of Pakistan and the data was collected from the total of 38 physiotherapists working in a multidisciplinary service line for more than two years. Consent and ethical approval was taken prior to conduct the study. Physical therapists of all the ages and both the genders were included the study. The data was collected through standardized tool of Attitudes Toward Health Care Teams scale (ATHCT) scale which is a 20-item tool and subscales on a 6-point Likert scale. Data was evaluated through SPSS version 20.

**RESULTS**

Demographic information shows that Out of 38 respondents 18 (47%) were female and rest 2 (5%) didn’t respond about their gender.

All items were coded in a way that increases in score over Likert scale showed favorability towards team work. Responses in favor of negative attitudes reflects response errors in data collection as majority of respondents have also showed agreement with their positive counterparts.

**DISCUSSION**

The Stroke Unit Trialists’ Collaboration review reported in 2001 updated in 2001 reported that stroke patients who receive inpatient organized care have more chances to recoup independence, earlier discharge from hospital and as compared to those who are receiving care in a less organized setup. In our study 42% of the physical therapists strongly agree that the team approach makes the delivery of care more efficient whereas 21% moderately agree and 31% somewhat agree.

Cifu and Stewart reported review of studies to predict outcome of stroke by receiving treatment through multidisciplinary teams. The authors concluded that assorted professionals constituting a multi-disciplinary team communicate on a regular basis and work towards a common goal which is a main factor for improved outcomes. Likewise, in our study 47% of the physical therapists strongly agree that a team primary purpose is to assist physicians in achieving treatment goals for patients and 39% moderately agree. Working towards a common goal has a strong relationship with improved functional outcome at hospital discharge and follow ups. Similarly in our study 34% of the physical therapist strongly agree that developing a patient care plan with other team members avoids errors in delivery care and 31% moderately agree and 26% somewhat agree.

Evans and colleagues conducted a clinical trial to evaluate the comparison of multidisciplinary inpatient physical rehabilitation programs with standard medical care for stroke patients. The researchers concluded that multi-disciplinary approach enhance functional abilities, improve survival and most autonomous discharge location for short term. Likewise in our study 65% of the physical therapists strongly agree that team approach improves the quality of care to patients and 23%
Finding of this study reflect that Speech-Language therapists have positive attitudes towards working in interdisciplinary health care teams. Literature suggests that incorporating interdisciplinary team work education in curriculum designed for degrees of health professionals can result in strong positive inclination towards medical team works.\(^{19}\)

**CONCLUSION**

Study reveals that MDT approach makes the delivery of care more efficient and treatment goals are easily achievable through better understanding the work of other professionals working in a team. It also described that patients who remained in organized multidisciplinary stroke unit are more likely to achieve functional skills and faster regain independence. It also shows that under the supervision of physicians and MDT the quality of care of stroke patients can be improved with patient satisfaction. Limitations & Recommendations

As mentioned before in results section that majority of participants agreed with negative attitudes on 4 out of 6 negatively worded items with same high percentages on their positive counterparts. Such dissonance in attitudes show response errors from participants which shows that statements have not been read carefully. Sample size was also too small to ensure generalizability of current research findings. Irreplaceable role of physical therapist as a member of health care team demands their positive attitudes towards team members and team work that serve as a predictor of their productive role in team. Therefore it is recommended to teach and train PTs about aspects of multidisciplinary team work during their professional degree education for rapid forward momentum of their expertise when they come in clinical practice.

**REFERENCES**

Physiotherapists perceived that MDT approach makes excellent with better outcomes. They believe in team therapists towards multidisciplinary team approach is. Findings indicate that the perception of physical therapists towards MDT in stroke rehabilitation multi-disciplinary teams for stroke rehabilitation. The perceptions of physical therapists towards multidisciplinary team approach working in stroke rehabilitation. The objective of the study was to evaluate the management of stroke is based on the intensive comparison with Western World (10-15%). (5, 6) In the stroke has inclined. Because of uncontrolled and rate of stroke has been declined but in the South Asian hemorrhagic stroke but the occurrence rate of ischemic no obvious cause of vascular origin. (1) According to world health organization stroke or transient ischemic attack is considered as major economic burden on part core and periphery members are the constituents of activities. (2, 9-11) Reverse coded items: 1=Strongly Agree, 2=Agree, 3=Somewhat Disagree, 4=Somewhat Agree, 5=Strongly Disagree.

INTRODUCTION

Stroke is a long term disability in developing countries usually the foundation of stroke units, and less usually toward health care teams scale (ATHCT) scale which is considered as a burning issue. (7, 8)

DISCUSSION

The beneficial outcomes of early stroke discharge teams earlier discharge from hospitals, inpatients resulted in decline in death, dependency and conventional treatment organized care of stroke stroke patients can be improved with patient satisfaction. Study reveals that MDT approach makes the delivery of care more efficient whereas 21% other team members avoids errors in delivery care and assist physicians in achieving treatment goals for other professionals working in a team. It also described that patients who remained in organized multidisciplinary other professionals working in a team. It also described limitation to the sample size which is considered as major limitation of this study. Therefore it is recommended to teach and train PTs about as a member of health care team demands their positive attitude towards health care teams: Proceedings of the sixteenth annual conference.
