Global research priorities to accelerate early child development in the sustainable development era

Between 1990 and 2015, the under-5 mortality rate declined by 53%, resulting in approximately 48 million more children reaching their fifth birthday than would have occurred had 1990 mortality rates continued. Many of these children, however, continue to live in conditions of adversity—marked by extreme poverty, undernutrition, conflict, and insecurity—and are not afforded the level of care required to ensure that they meet their developmental potential. Neuroscience research in the past two decades is unequivocal that the period from conception through early childhood (ie, at least the first 3 years) is foundational in terms of brain development. There is increasing evidence (mostly from high-income countries) that delivering quality interventions in the early years is cost-effective, reduces health inequities, improves learning and academic attainment, lowers crime and violence, and can substantially improve adult health and economic productivity. For the first time, the foremost global development framework—the new Sustainable Development Goals (SDGs)—includes child development, under target 4.2. This is also reflected in the new Global Strategy for Women’s, Children’s and Adolescents’ Health (2016–2030), within which one of the core objectives is to ensure that all women, children, and adolescents have an equal chance to thrive (and not simply survive). Thus, any research agenda that aims to give young children the chance to both survive and thrive must ensure that early child development (ECD) is prioritised in order to inform policy and programmatic implementation and achieve the SDG target. Although the scientific evidence is clear, donor and policy neglect of ECD has been striking. Recently however, high-level support for ECD has been emerging, including in the

ECD=early child development.

Table: Top three priority research questions in each thematic goal
recent *Lancet* Series. To optimise the impact of this new momentum, ECD research prioritisation is required.

Between February and November, 2015, we conducted a priority-setting exercise to set research priorities for ECD to 2025. This is part of WHO’s larger initiative to set priorities for maternal, newborn, child, and adolescent health. We used the Child Health and Nutrition Research Initiative (CHNRI) methodology for setting priorities in health research investments because: (a) it is a carefully developed and documented conceptual framework available in the public domain; (b) it has demonstrated usefulness in several previous exercises; and (c) it is increasingly being used by policy makers, large donors, and international organisations. We adapted a set of five criteria from the CHNRI methodology—answerability, effectiveness, feasibility, impact, and effect on equity—against which an expert group scored research investment priorities. Library searches and snowball sampling were used to identify 348 experts (both researchers and programme experts) who were then approached by email to provide their three to five top research questions. 74 participants responded, generating 406 research questions, which we then collated into a composite set of questions by eliminating redundancies and overlaps, excluding irrelevant questions, and identifying thematic areas. This process yielded 54 questions that were then scored by 69 of the original experts against the five criteria outlined above. Composite scores ranging from 0 to 100% were calculated for each research question. The experts who completed scoring were geographically diverse, with 7% from WHO African Region, 34% from the Americas, 5% from Eastern Mediterranean Region, 18% from European Region, 11% from South-East Asian Region, and 8% from Western Pacific Region; 18% considered themselves international (WHO or UNICEF or international non-governmental organisations or agencies).

The research questions were organised by six thematic goals. The table presents the goals and the top three research questions for each of the goals, including their ranking. Research priority scores among the top 10 priorities ranged from 82% to 87%. All of the top-ranked priorities were related to the impact of implementation of interventions, whether by community health workers or through increased support to parents and families. Three of the top 10 ranked priorities related to integration, such as integrating ECD services within maternal, newborn, and child health services or the additive costs of integrating health or nutrition interventions into early childhood education programmes. There were no questions in the top 10 about epidemiology, basic science, or discovery, although questions arose about interactions between nutrition and physical and cognitive development.

The results of this process clearly indicate that the crucial priorities for future research relate to the need for services and support to parents to provide nurturing care and the training of health workers and non-specialists. What is most striking about the top-ranked priorities is the emphasis on creating enabling environments to support families in providing nurturing care for young children, which is a key message of *The Lancet* Series on Early Child Development. In addition, the emphasis on integration is important—also emphasised in *The Lancet* Series—as it speaks to the importance of implementing programmes using existing delivery platforms such as maternal and child health and nutrition services. Given the current global focus on quality of care, the high priority given to questions of maintaining impact when going to scale is important as well as improving the policy environment, improving quality of interventions, and increasing effectiveness and improving demand.

Currently, research funding for the “thrive” component of the Global Strategy is lower than for the survival agenda for children. The SDG agenda places ECD in the centre of global efforts to improve human capital. We encourage international organisations, national governments, research institutes, and donors to consider the findings of this exercise in order to address key gaps in our knowledge and enhance the ECD agenda and the achievement of the SDGs.
